To whom it may concern,

In todays fast paced society a lot of homes are resorting to premade quick fix foods. Most of these foods contain the potentially harmful color additive, yellow #6.

For example, my child would typically eat frozen eggs waffles for breakfast w/ fruit and trix yogurt. For lunch, he may eat cheezits or ritz bits w/cheese a sandwich with sunny delight juice. For dinner we could have chicken with mac n cheese along with some veggies. — Wow, - that's scary. Not to mention the popsicle consumption on hot days, it's a considerable amount of food containing that food additive (along w/others) in just a day.

My question is - Has the FDA taken into consideration the amount "possibly" consumed in a day of this additive?

OON-1262

C1

Certainly, each individual food may have safe amounts of ~~the~~ potentially harmful additives, but, when combined, as per my example, I feel it could be dangerous.

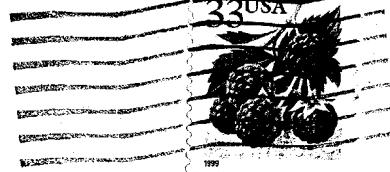

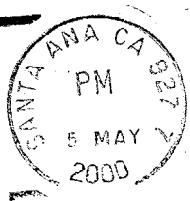

Your response would be greatly appreciated.

Sincerely,

Donna Gill
